# HomeGrass

Artificial Grass installation

1. Surface preparation

Clean the surface of any weeds and/or natural lawn (removal from their roots).
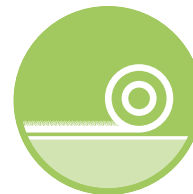

2. Geotextile installation

Place the geotextile over the entire surface to minimize the chances of weeds growing in the future.

3. Sand distribution

Distribute concrete sand with a thickness of at least 3 cm for better drainage. Next: water the sand and press it with a roller.

4. Lay down the artificial grass

Lay the pieces of artificial grass on the ground and open them starting from the corner of the surface.

5. Cut artificial grass to size

Cut the grass from the top. Place the next piece of grass and align parallel to the previous piece.
Important: Ensure that the pile direction is facing the same way.
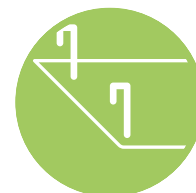

6. Join the pieces

For **small surfaces** it is recommended to use adhesive tape. Lift and fold back both pieces of artificial grass. Place the adhesive tape between them and stick down the two pieces of artificial grass pressing firmly down.

For **large surfaces** use two-component glue and joint tape. Lift and fold back both pieces of artificial grass. Place the joint tape between the two rolls (shiny side down). Apply the glue evenly across the tape and stick down the two pieces of artificial grass pressing firmly down.

7. Secure artificial grass

Secure the perimeter using 16 cm long nails at a distance of 30-50 cm between them.

8. Brush artificial grass

Finally straighten up the fibers by brushing or blowing with an electric blower against the pile direction.

... Enjoy amazing moments with our loved ones!
