

ARTIFICIAL GRASS INSTALLATION INSTRUCTIONS

For surfaces with natural grass or soil

STEP 1 SURFACE PREPARATION

We clean the surface of any weeds and/or natural lawn (removal from their roots).

STEP 2 GEOTEXTILE INSTALLATION

We place the geotextile over the entire surface to minimize the chances of weeds growing in the future.

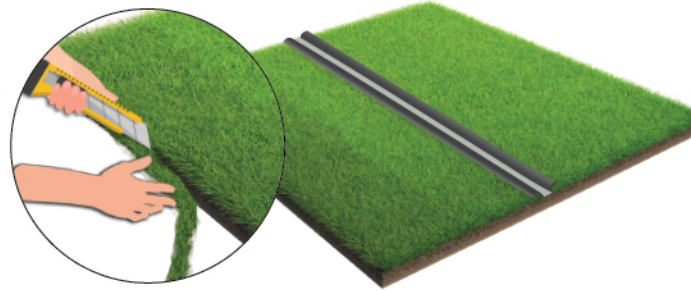

STEP 3 SAND DISTRIBUTION

We proceed with the distribution of concrete sand with a thickness of at least 3 cm for better drainage. Then we water the sand and press it with a roller.

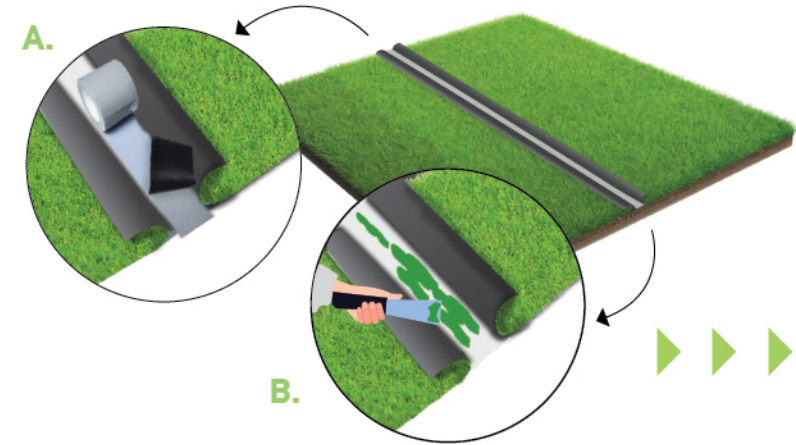

4.1

4.2

4.3

STEP 4 ARTIFICIAL GRASS INSTALLATION

4.1_We lay the pieces of artificial grass on the ground and open them starting from the corner of the surface we wish to cover.

4.2_We cut the grass from the side of the coating using a stanley knife. Then we place the other piece of grass and align the two pieces parallel to each other.

Important: Ensure that the pile direction is facing the same way.

4.3_ Joining:

A: For small surfaces, it is recommended to use adhesive tape. Lift and fold back both pieces of artificial grass. Place the adhesive tape between the two rolls and return the two pieces of artificial grass to the ground so that they stick to the tape by pressing firmly down.

B: For large surfaces, it is recommended to use two-component glue and joint tape. Lift and fold back both pieces of grass. Place the joint tape (shiny side down) between the two rolls. Apply the glue evenly across the tape and return the two pieces of artificial grass to the ground so that they stick to the tape by pressing firmly down.

STEP 5
SECURE ARTIFICIAL GRASS

Secure the perimeter using nails 16 cm at a distance of 30-50 cm between them.

STEP 6
BRUSH ARTIFICIAL GRASS

Upon completion of installation, straighten up the fibers by brushing or blowing with an electric blower in the opposite direction.
